Prospects for South Korean Defense Spending

25X1

Summary

We believe that South Korea remains committed to allocating a fixed percent of gross national product (GNP) to defense. Nonetheless, a change in the method of calculating GNP will leave the ratio below the 6-percent level in 1985, and budget austerity over the next year or two will complicate prospects for a near-term return to the 6-percent level.

25X1

25X1

South Korea's failure to reach 6 percent of GNP for defense over the last two years results primarily from a recomputation of national accounts in accordance with recommendations of the International Monetary Fund. The use of more sophisticated data collection methods, as well as the inclusion of some new industries and economic activities, in fact produces significantly higher GNP estimates for the past ten years. Measured against these new estimates, defense spending has surpassed 6 percent of GNP only in 1980, 1981, and 1982. (See table for a comparison of adjusted rates of defense spending.

25X1

Unexpectedly strong growth in 1983 and 1984 also pushed the ratio down as nominal GNP in both years surpassed estimates made when defense plans were formulated.

The 1985 Debate

25X1

In planning defense expenditures for 1985, the South Korean Government was concerned that allocating 6 percent of GNP under the new accounting ground rules would require a boost of better than \$500 million in expenditures. Such an increase for an economy with an estimated \$79 billion GNP and a \$13 billion national budget would necessitate sharply reduced outlays in nondefense areas. Moreover, critical economic stabilization measures entailed in Seoul's commitment under a standby agreement with the International Monetary Fund would have to be sacrificed. [REDACTED]

25X1

Deputy Prime Minister Shin Byong Hyon in talks with US officials has emphasized that no one in Seoul questions South Korea's commitment -- conveyed verbally by the late President Pak Chung Hee in 1979 -- to stand by the 6-percent spending goal. He has also suggested that Seoul will again attain the 6-percent level, perhaps as early as 1986. [REDACTED]

25X1

We believe Seoul will make a serious effort to again reach the 6-percent target. Although slower economic growth next year will make the targeted ratio easier to attain in the short term, maintaining the ratio over the long term may become difficult because of declining growth in revenue. Moreover, Seoul will probably continue to seek access to IMF funds when the current arrangement expires next March. A continued agreement with the IMF will almost certainly contain a clause restricting budget deficits. The government, for its part, will probably continue to put priority on restraining inflation and slowing growth of foreign debt. These considerations will tend to make Seoul wary of increasing overall government spending, including that for defense. [REDACTED]
